

Metatranscriptomics

Dr. Natalia Zajac

Metagenomics, 9.12

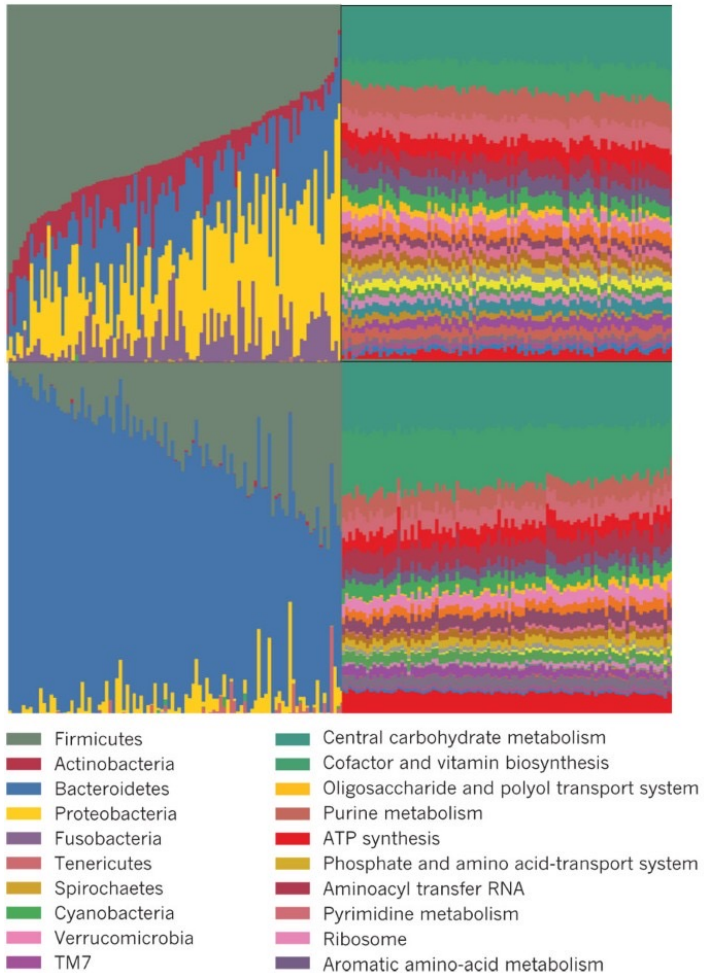

Overview

- What is metatranscriptomics - how does it relate to RNAseq and how does it differ from metagenomics?
- Processing of reads and statistical analysis
 - Quality filtering
 - Assembly/Mapping to databases
 - Functional and taxonomic annotation
- Visualization
- Research questions and case studies

What is metatranscriptomics?

Phylum

Function

16S rRNA can tell
us **WHO IS THERE?**
But is what you see
a cause or
consequence?

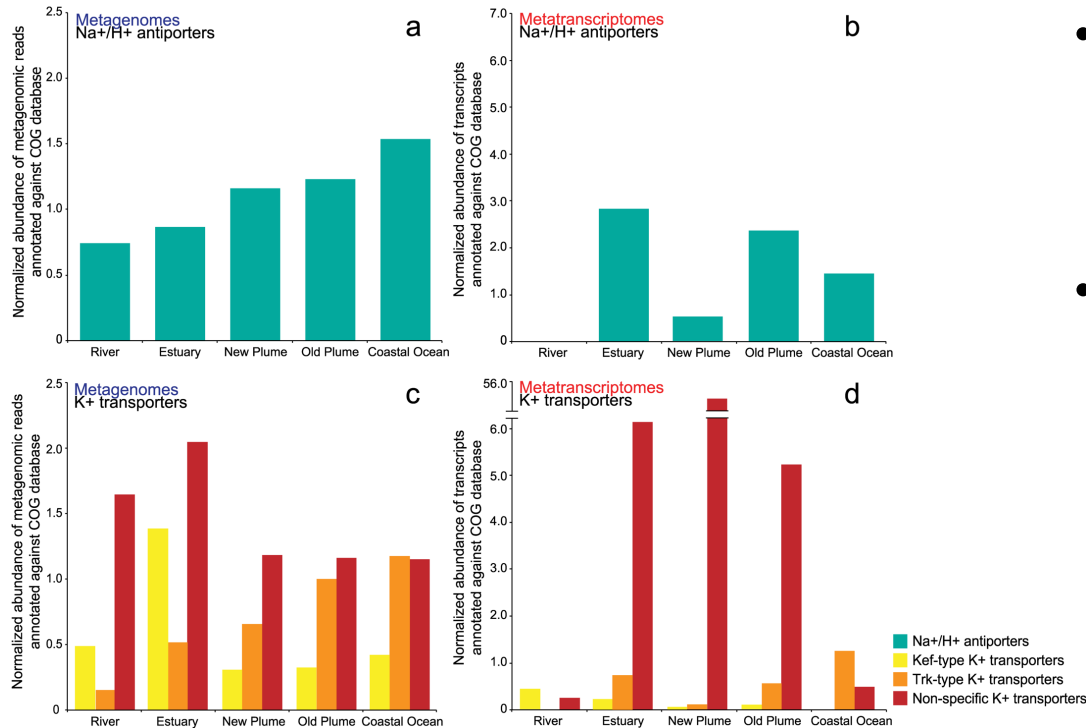

Claassen-Weitz et al. 2020

Metatranscriptomics
can tell us **WHO IS**
DOING WHAT? –
microbiome activity

Shotgun metagenomics
can tell us **WHO IS**
THERE? And WHAT IS
THEIR FUNCTIONAL
POTENTIAL?

What is metatranscriptomics?

- **FUNCTION:** Which genes and pathways are actively expressed within a community
- **TAXONOMY:** Which taxa are responsible for the metabolic activity BUT NOT WHO IS THERE

Metabolic potential - highly similar across samples (with few differences in functional gene abundance from river to ocean)

Gene expression - highly variable and generally was independent of changes in salinity

EXAMPLE

Research | [Open Access](#) | [Published: 06 September 2017](#)**Perilipin-2 modulates dietary fat-induced microbial
global gene expression profiles in the mouse intestine**[Xuejian Xiong](#), [Elise S. Bales](#), [Diana Ir](#), [Charles E. Robertson](#), [James L. McManaman](#), [Daniel N. Frank](#)  &
[John Parkinson](#) [Microbiome](#) **5**, Article number: 117 (2017) | [Cite this article](#)**2958** Accesses | **9** Citations | **3** Altmetric | [Metrics](#)

- Plin2 (Perilipin2) – involved in lipid uptake, interacts with lipid droplets
- Study comparing WT and Plin2-null mice - exposure to high-fat/low-carb (HF) or low-fat/high-carb (LF) diets

EXAMPLE

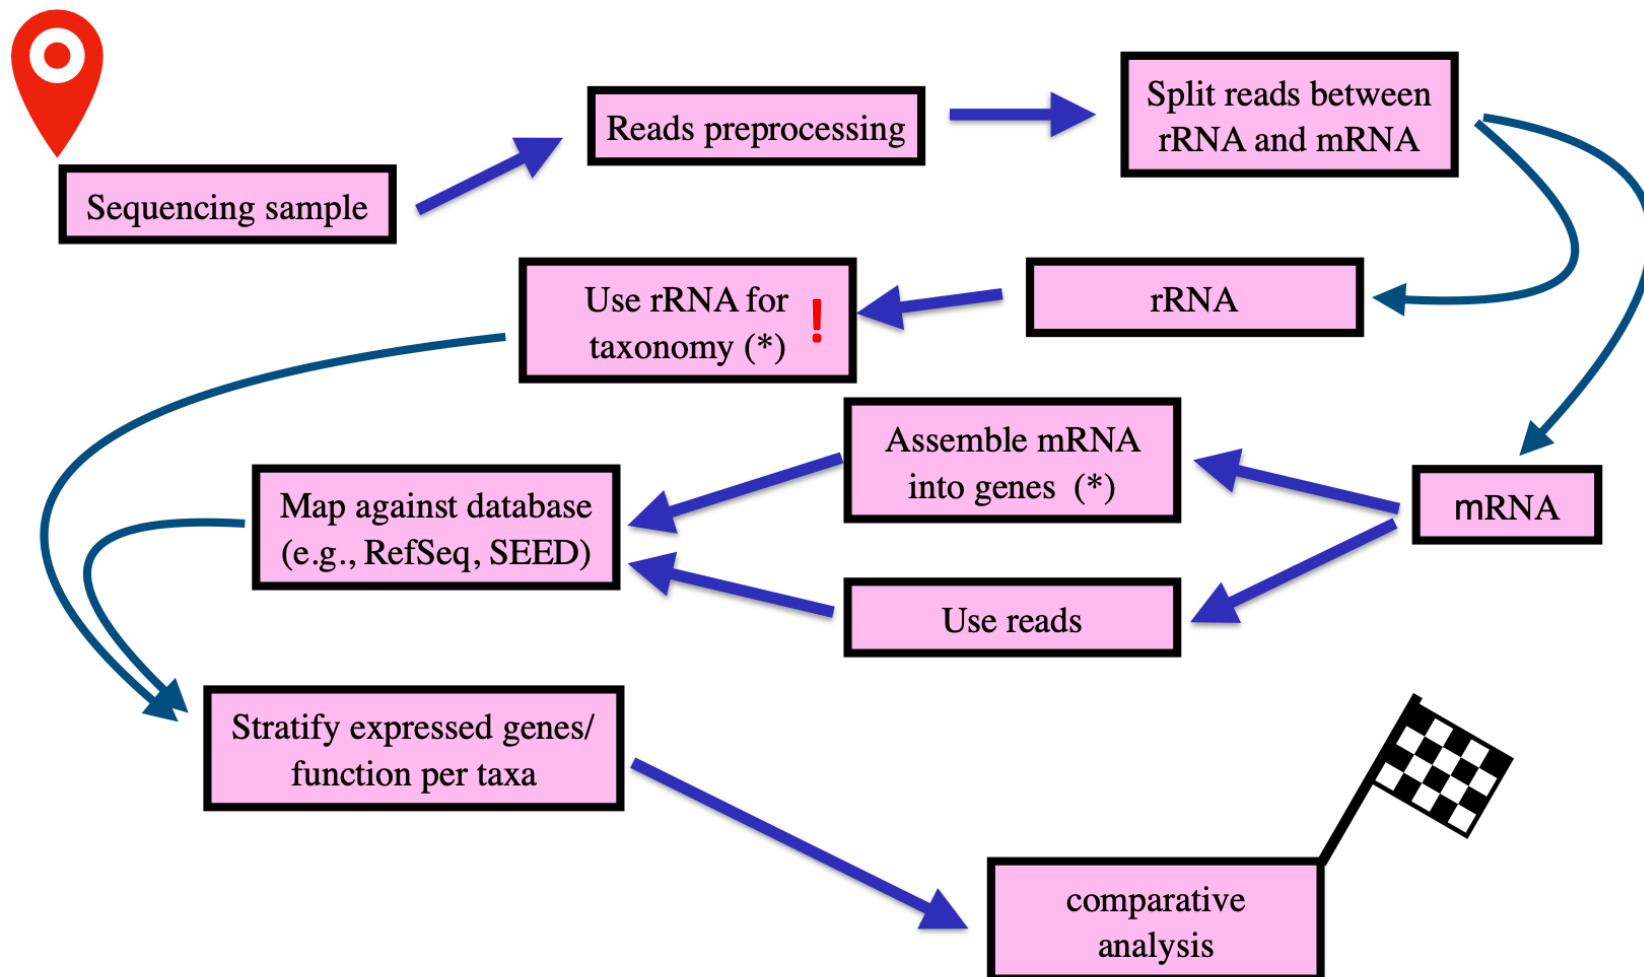

Perilipin2 KO mice fed a high fat diet exhibited a similar microbiome as WT mice fed the same diet....

...however metabolic pathways are differentially expressed – host genotype impacts microbiome function

WORKFLOW

CHALLENGES

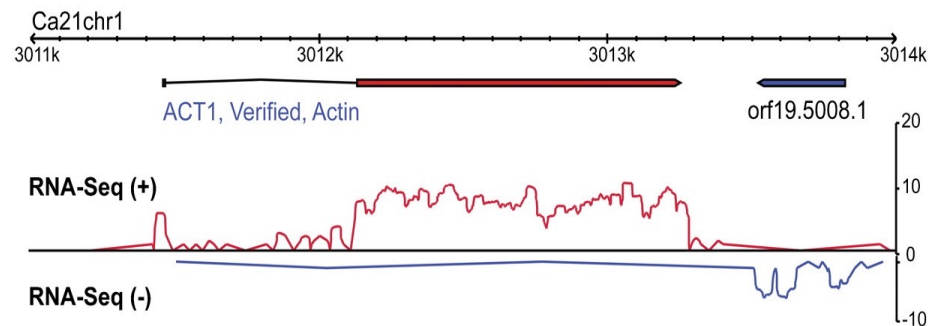

In a typical RNA-Seq experiment applied to a single eukaryotic organism, **mRNA** is **isolated**. After **fragmentation** and **sequencing**, reads are mapped to a reference genome using standard software such as **BWA** and **STAR** to provide: 1) support that the transcript is expressed; 2) the relative abundance of the transcript; and 3) the presence and abundance of isoforms

Resource

Comprehensive annotation of the transcriptome of the human fungal pathogen *Candida albicans* using RNA-seq

Vincent M. Bruno,¹ Zhong Wang,² Sadie L. Marjani,³ Ghia M. Euskirchen,⁴ Jeffrey Martin,² Gavin Sherlock,^{4,5} and Michael Snyder^{1,4,5}

¹Department of Molecular, Cellular, and Developmental Biology, Yale University, New Haven, Connecticut 06520, USA; ²DOE Joint Genome Institute (JGI), Walnut Creek, California 94598, USA; ³Department of Genetics, Yale University School of Medicine, New Haven, Connecticut 06520, USA; ⁴Department of Genetics, Stanford University Medical School, Stanford, California 94305-5120, USA

For microbiome samples we have the following problems:

- a) Lack of a polyA signal makes it difficult to isolate bacterial mRNA and resulting in (massive) rRNA contamination
- b) Environmental microbiome samples lack reference genomes making it difficult to map reads back to their source transcripts
- c) Host contamination

CHALLENGES

RNA quality deteriorates rapidly – Method of storage and preparation can impact taxa recovered and has yet to be standardized

Best(?): Process immediately to extract RNA then store at -80

Next best(?): Snap freeze in liquid nitrogen and store at -80

Avoid use of RNALater – it lyses some cells and can interfere with RNA extraction kits (e.g Ambion RiboPure Bacteria Kit / LifeTech Trizol Plus)

Standard Sequencing Recommendations

NovaSeq; 100bp single-end reads; 40M reads/sample
Packs of 200M reads

Costs for UZH and ETHZ research groups

Library preparation	190 CHF / sample
Sequencing 200M reads (5 samples)	1037 CHF
Bioinformatics (up to 15 samples, 3 comparisons)	880 CHF

Number of biological
replicates

At least 2!

Power analyses
challenging

HOW MANY READS IS ENOUGH

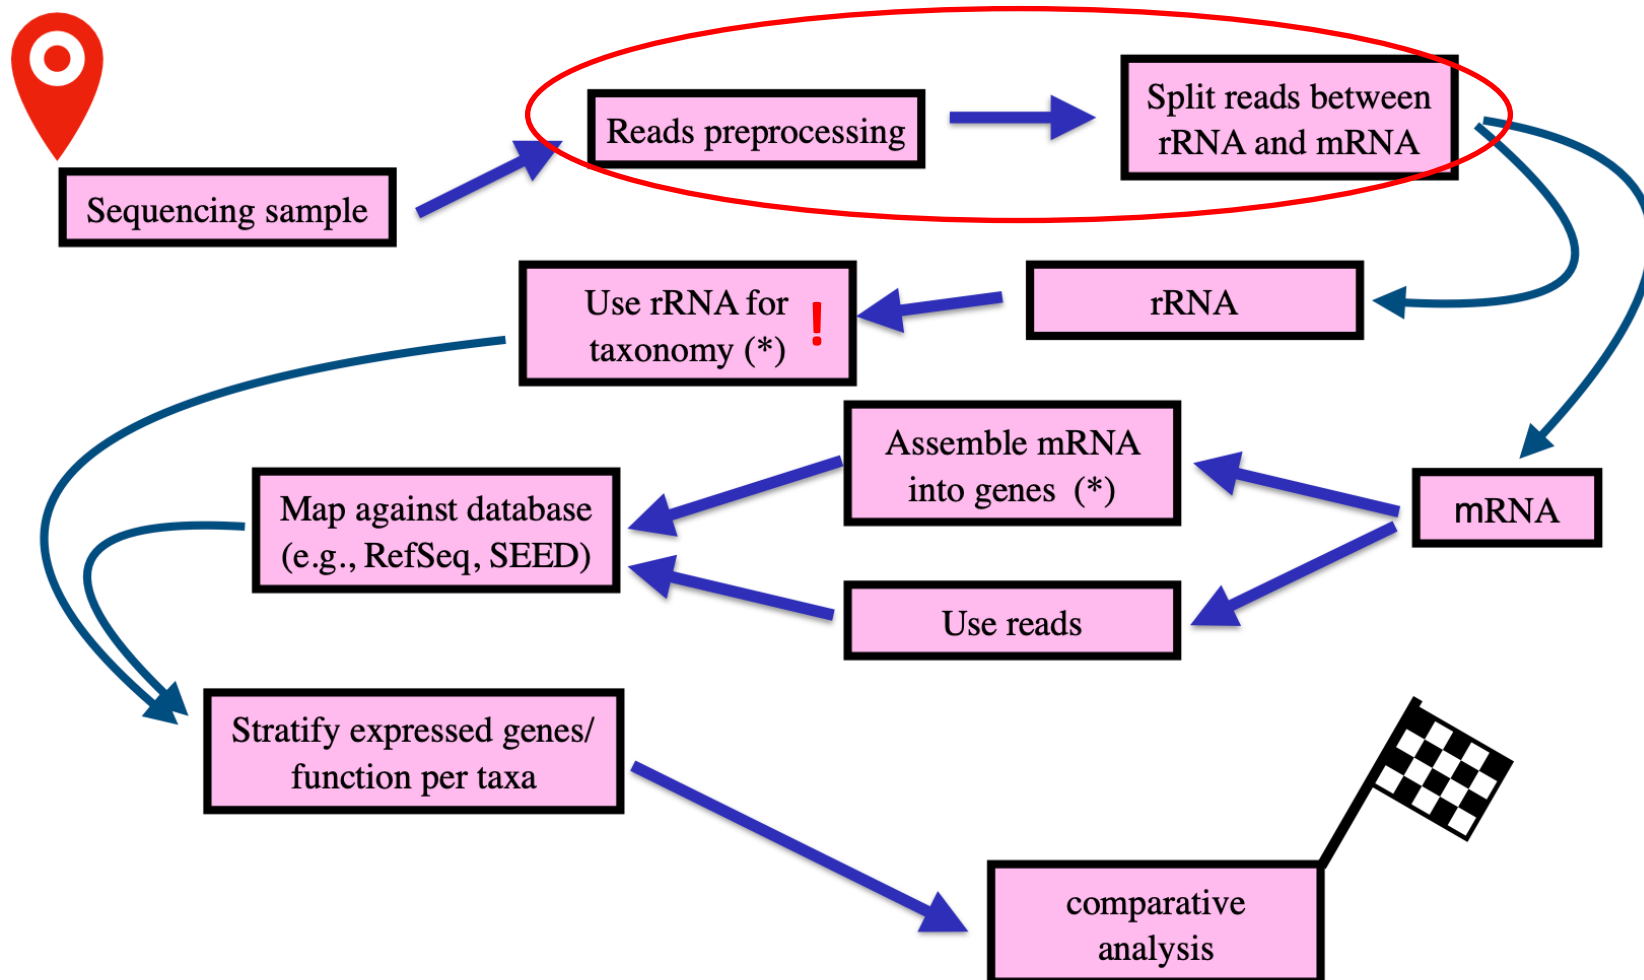

<https://bioinformatics.ca/>

~5 million mRNA reads provide 90-95% of ECs in a microbiome

With kits yielding mRNA read rates of ~25%, this suggests 20 million/sample mRNA

WORKFLOW

Preprocessing

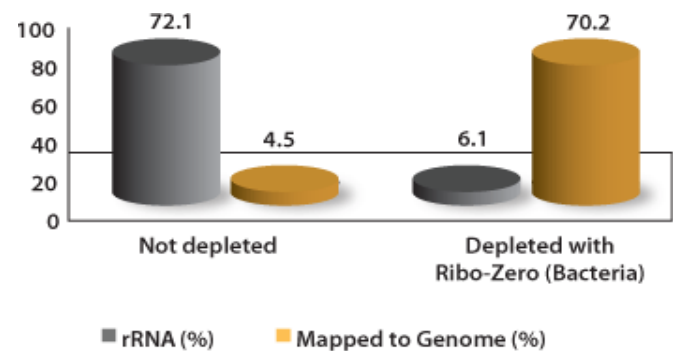

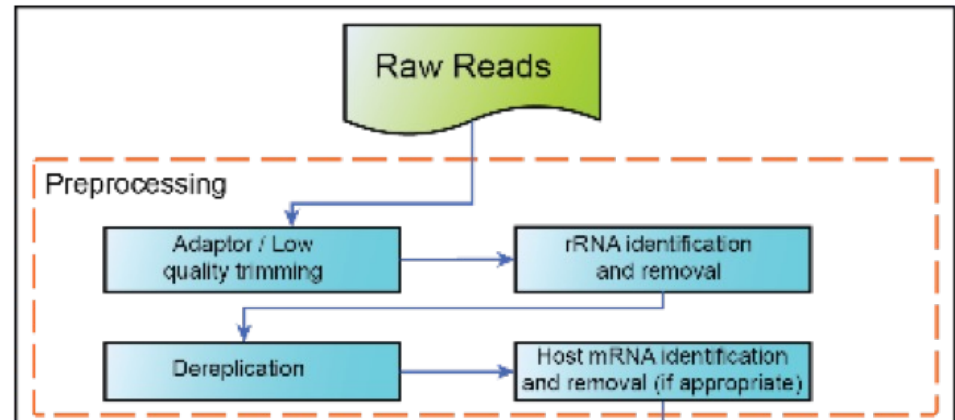

Trimmomatic - removal of:

- low quality
- Adaptors

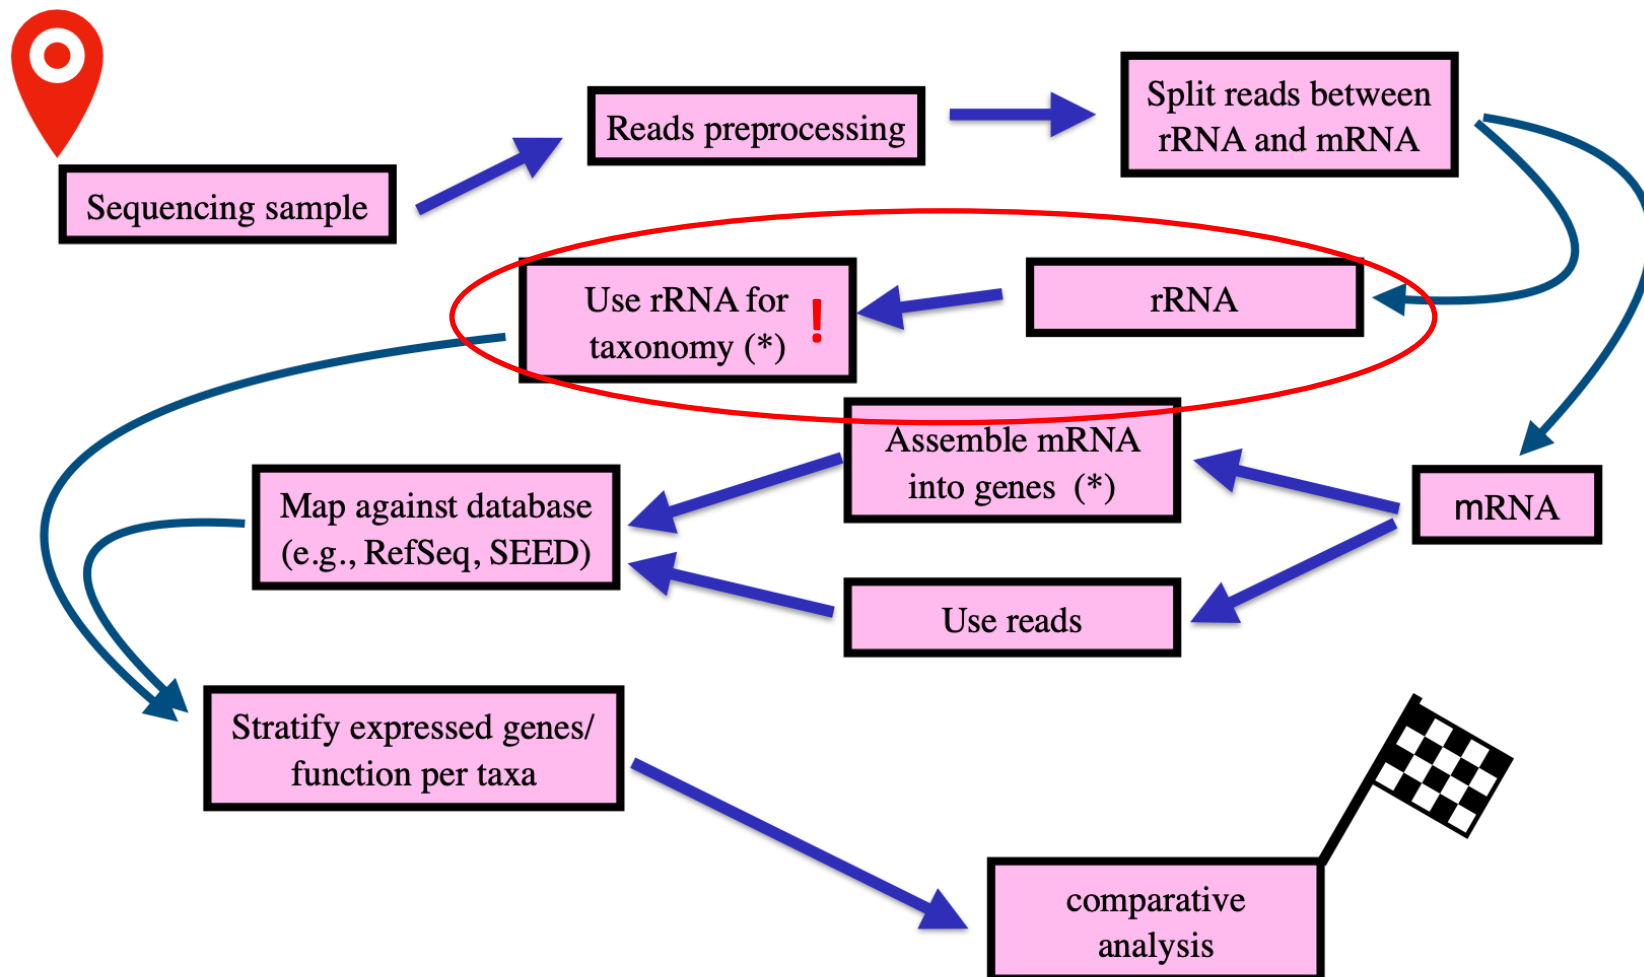

BWA/BLAT – alignment of reads to
(and removal)

- Host transcriptome
- rRNA databases

SortMeRNA/Infernal – removal of
rRNA

WORKFLOW

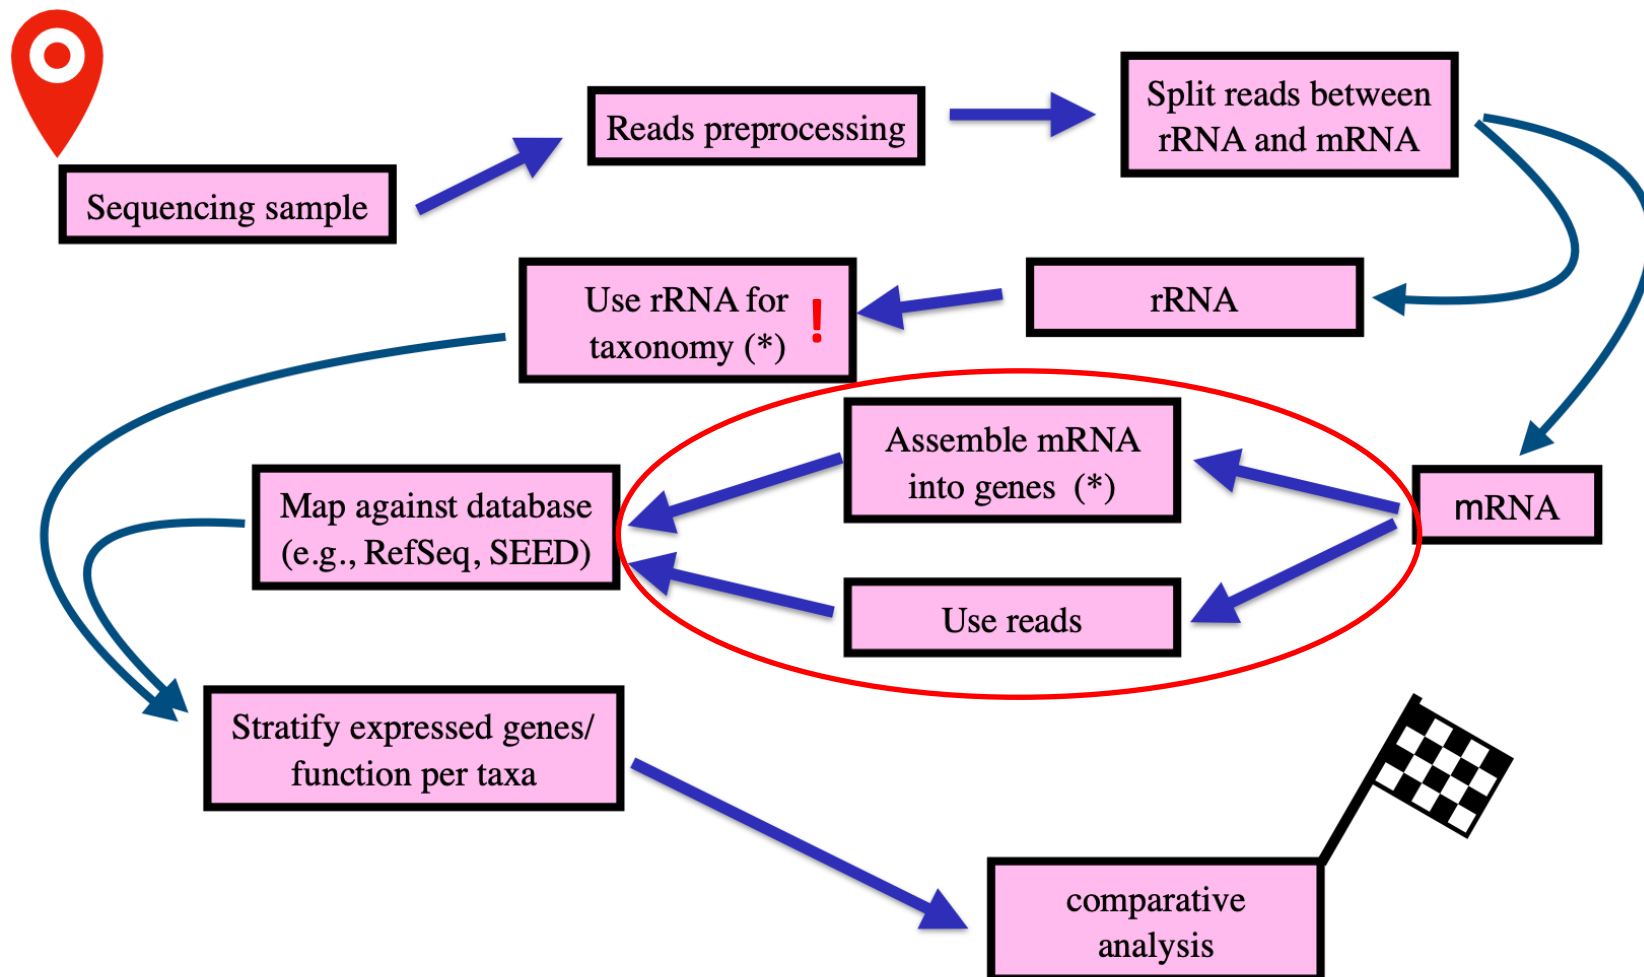

rRNA

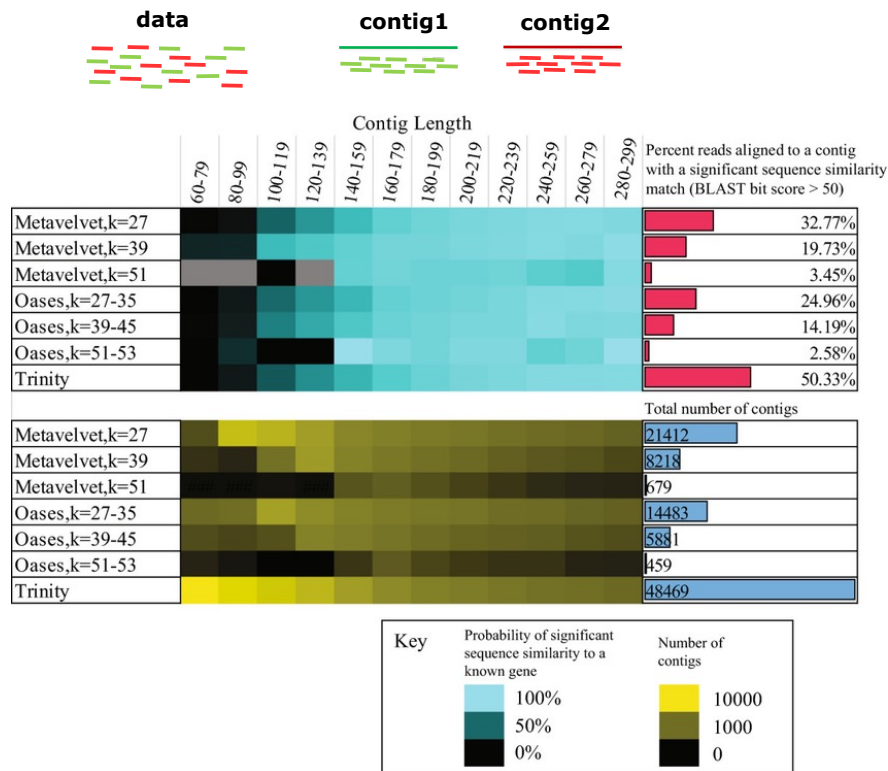

- Reads assigned to the rRNA database can be used for taxonomic classification
- BUT VERY OFTEN rRNA DEPLETION KITS ARE USED BEFORE EXTRACTION
- Not all species are equally depleted

WORKFLOW

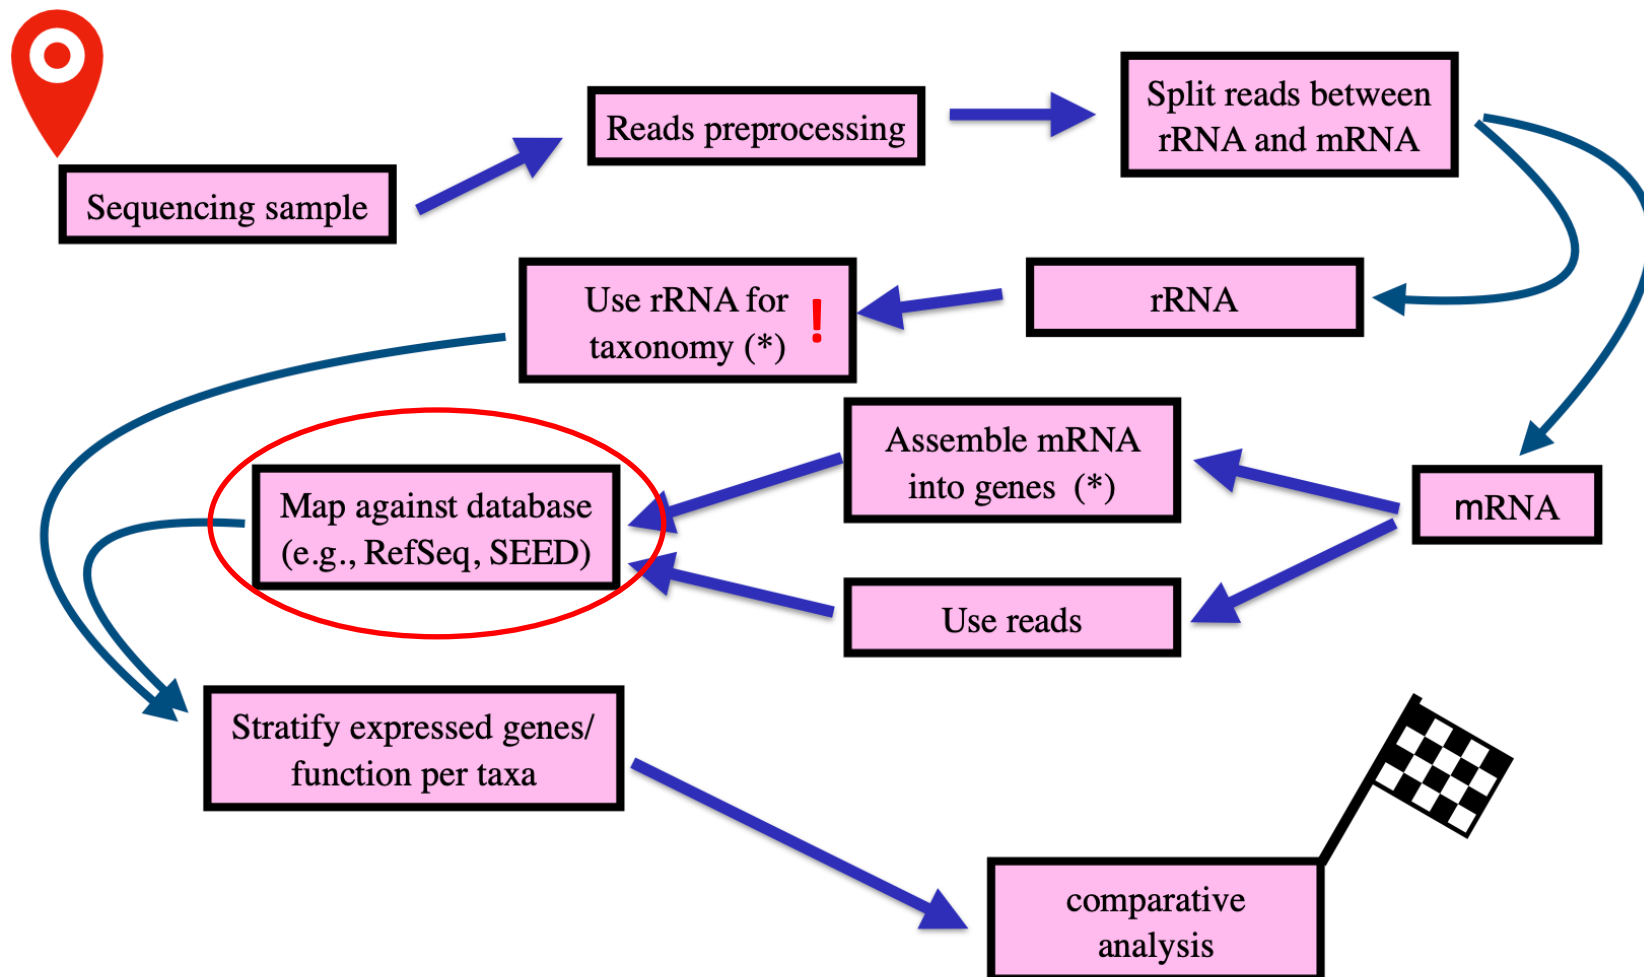

ASSEMBLY

- Reads can be assembled de novo into genes
- Assembly improves annotation accuracy
- Originally Trinity was used but now Spades
- Pros:
 - splicing better handled for eukaryotes
- Cons:
 - time consuming,
 - computationally intensive,
 - hardly needed for bacteria
 - Chimeras, missassembled contigs – there are tools for identification of those

WORKFLOW

Annotation with databases

- Relies on sequence similarity searches with tools such as BLAT, BLAST, BWA
- BWA, BLAT – rely on near perfect matches
- Local alignment with Smith-Waterman algorithm
- BLAST – very time consuming → Diamond – in a blastx mode, much faster

Summary of BLASTX matches for a
mouse metatranscriptome
% of Read Length

	55	60	65	70	75	80	85	90	95	100
35	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0

50	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.1	0.2	0.1
55	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.2	0.4	0.3
60	0.0	0.0	0.0	0.0	0.0	0.1	0.1	0.5	0.7	1.6
65	0.0	0.0	0.0	0.0	0.0	0.1	0.2	0.9	1.3	1.5
70	0.0	0.0	0.0	0.1	0.1	0.3	0.3	2.2	1.6	1.7
75	0.0	0.0	0.1	0.2	0.3	0.4	0.5	1.6	3.8	2.0
80	0.0	0.0	0.0	0.3	0.5	0.5	0.5	1.7	2.4	4.9
85	0.0	0.0	0.1	0.5	0.9	1.1	0.8	1.8	2.7	3.3
90	0.0	0.0	0.2	0.9	0.6	0.6	1.7	1.9	3.3	4.0
95	0.1	0.1	0.2	0.8	0.6	0.6	0.7	1.9	3.7	4.8
100	0.1	0.2	0.3	0.6	0.7	0.7	1.3	2.9	8.6	12.1

You want to filter based on % of read length but also % ID of match

MANY READS STILL COME OUT UNANNOTATED

Annotation with databases - taxonomy

Assigning RNA reads to taxa might reveal which critical functions are associated with whom
It could also help binning for the assembly.

Annotation with databases - taxonomy

Sequencing Read

1. Translation

Translate nucleotide sequence into amino acid sequences by the six possible reading frames and split into *fragments* at stop codons.

2. Sorting

MEM Sort fragments by length > m

3. Database search

Find MEMs with length > m

● Stop search

Assign read to the taxon with longest match

Greedy Sort fragments by score > s

Find matches with score > s

● Stop search

Assign read to the taxon with highest scoring match

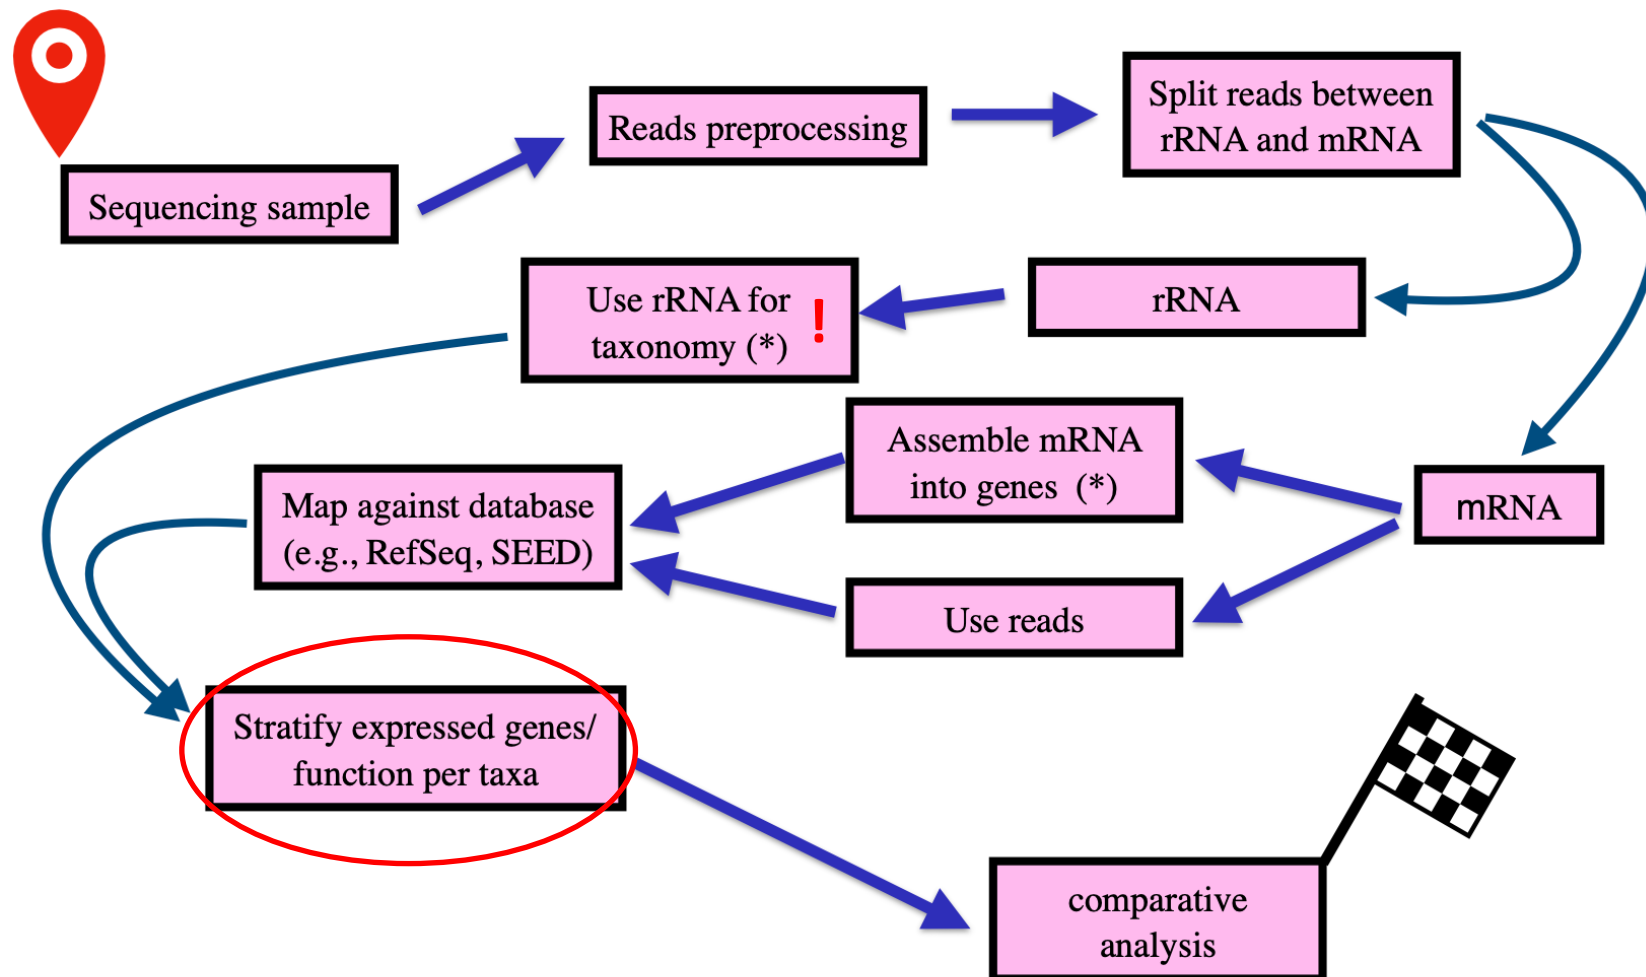

- How Kraken works already mentioned
- Mapping to Refseq or Subsystems done with Diamond (blastx type of search)
- A lot of the methods work on Nearest Neighbour to assign sequence to the genome
- Kaiju is based on Burrows Wheeler Transform (BWT) and also uses a database e.g. RefSeq
 - Fast
 - Accounts for sequencing errors
 - Needs large amount of memory
 - Features a GUI to explore results

Annotation with databases - taxonomy

- Diamond used in standardized workflows
- For a SPF mouse gut microbiome – DIAMOND annotates most reads

WORKFLOW

Mappings -> gene expression

To normalize expression to account for differences in gene length - read counts are converted to *Reads per kilobase of transcript mapped (RPKM)*

Longer transcripts should have more reads mapping to them

$$RPKM_{\text{geneA}} = 10^9 C_{\text{geneA}} / NL$$

C_{geneA} = number of reads mapped to geneA

N = total number of reads

L = length of transcript in units of Kb

Several softwares are available to do mapping and calculate normalized expression measurements across different samples including Bowtie and Cufflinks

But also implemented in several standardized workflows

Functional annotation/stratification

Mapping transcripts to more general functions

- Gene Ontology Annotation can help stratify functions assigned to transcripts: EggNOG, OMA, Pannzer2

- Mapping transcripts into more general functions – transcripts might not be important but might code for similar functions

Functional categories

Genes and proteins form parts of interconnected functional modules

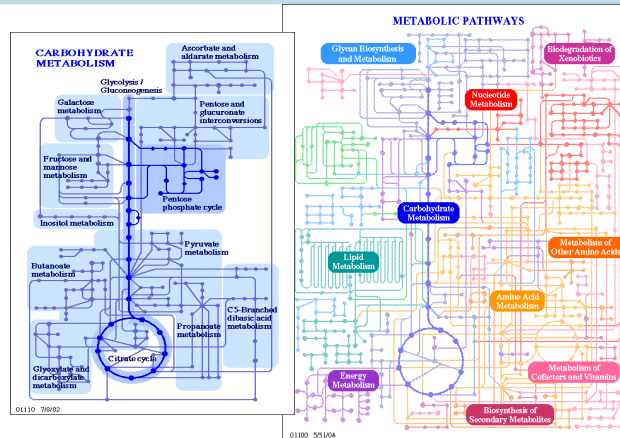

Grouping gene functions into larger categories can help explain which metabolic processes are most important in the sample/ different between samples.

Taxonomy from mRNA expression \neq rRNA abundance

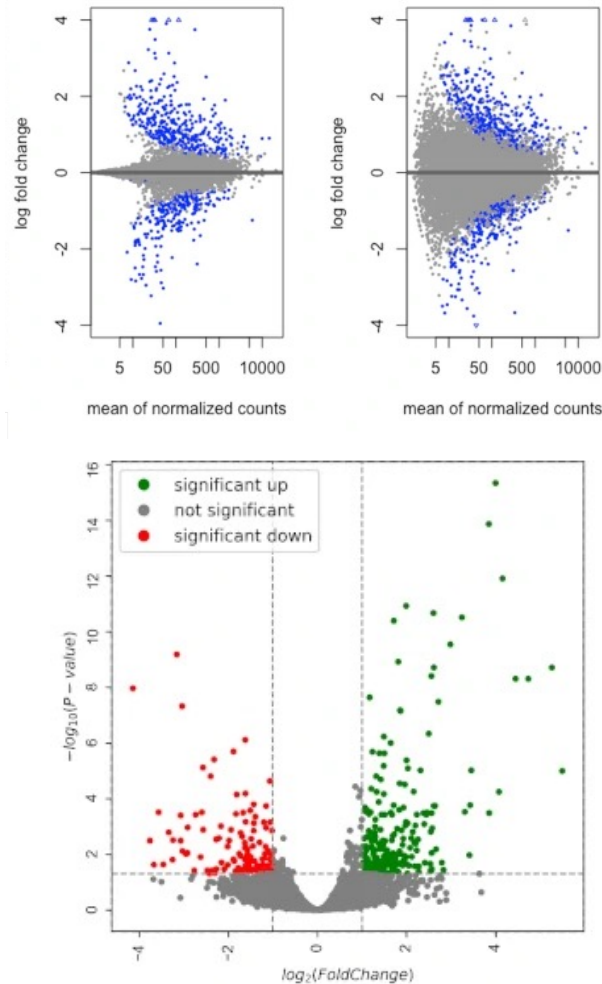

- Comparison of mRNA vs. rRNA based abundance estimates
- Abundance not the same as expression!!
- Differences can be subtle but also can be big

WORKFLOW

Statistical/ comparative analysis

- DESeq2 takes in a count table

1. Normalisation

- **geometric mean** is calculated for **each gene** across all samples,
- **counts for a gene in each sample** is **divided** by this mean,
- **median** of these ratios in a sample is the size factor for that sample

2. Variance estimation (dispersion and fold changes)

- within-group variance calculated between replicates
- shrinkage estimation for dispersions and fold changes
- dispersion value is estimated for each gene through a model fit procedure.

3. Differential expression

- negative binomial generalized linear models fitting for each gene and the Wald test for significance testing

Samsa2 (<https://github.com/transcript/samsa2>)

README.md

SAMSA2 - A fork of the complete metatranscriptome analysis pipeline

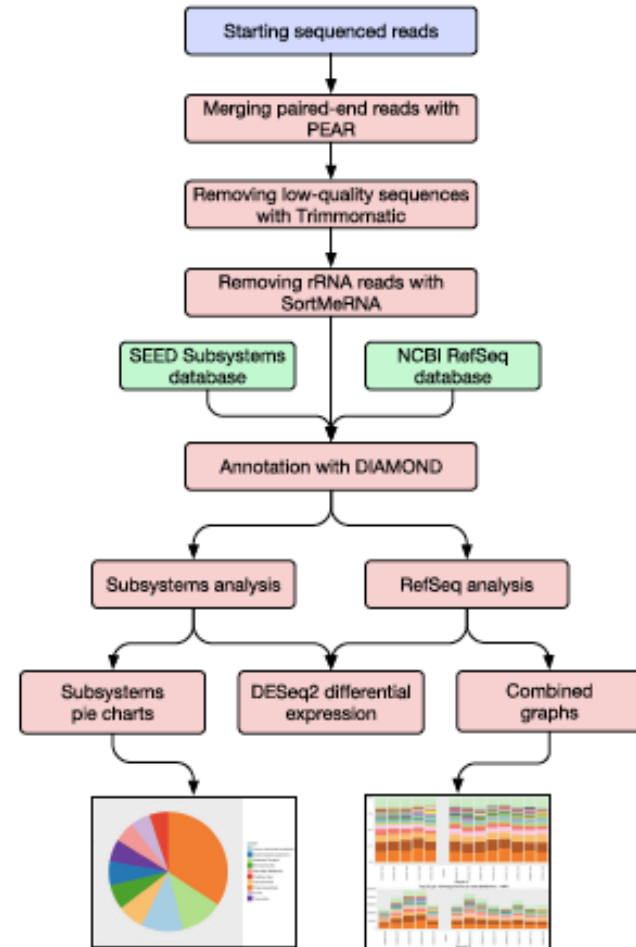

Version 2 of the SAMSA pipeline - faster! Lighter! More options! Less waiting!

New in version 2:

- DIAMOND integration, allowing for SAMSA2 to be run without ever needing an MG-RAST account.
- Option to annotate against custom databases.
- Better, more polished R scripts that can be executed from the command line.
- PCA plots and other graphical outputs.
- Filtering of ribosomes for even more speed.
- And more!

Remarks

- All tools nicely wrapped up

Tutorial – Bacterial Vaginosis

- multifactorial disease characterized by a shift from the *Lactobacillus* species-dominated microbial community toward a taxonomically diverse anaerobic community
- 8 women diagnosed with BV
- 4 successfully treated, 4 not
- Paired-end seq performed on a HiSeq 2500 Sequencer to yield 2×110 -bp
